

Rustguard

Prevent rust inside your factory following pickling operation or shot peening (media blast) by this rustguard product.

Rustguard – BL400

Heat treated ferrous alloys are likely to corrode before the next operation if they are not protected from rust.

This product is designed to deposit a protective film on parts to prevent corrosion. This product is in a hydrocarbon base solvent that dries, leaving a thin protective layer of corrosion inhibitor. Especially designed for disk brake parts, steel rods, springs or iron cylinder liners.

The product displaces water and provides rust protection for up to one year. Water quenched salt bath hardened parts can be protected as well as acid pickled steels.
